# 1 Overview

This chapter gives an overview of the 512-Mbit Double-Data-Rate SDRAM product family and describes its main characteristics.

## 1.1 Features

- Double data rate architecture: two data transfers per clock cycle
- Bidirectional data strobe (DQS) is transmitted and received with data, to be used in capturing data at the receiver
- DQS is edge-aligned with data for reads and is center-aligned with data for writes
- Differential clock inputs (CK and  $\overline{\text{CK}}$ )
- Four internal banks for concurrent operation
- Data mask (DM) for write data
- DLL aligns DQ and DQS transitions with CK transitions
- Commands entered on each positive CK edge; data and data mask referenced to both edges of DQS
- Programmable CAS latency: 2, 2.5, 3
- Programmable burst lengths: 2, 4, or 8
- Auto Precharge option for each burst access
- Auto Refresh and Self Refresh Modes
- RAS-lockout supported  $t_{\text{RAP}} = t_{\text{RCD}}$
- 7.8  $\mu\text{s}$  Maximum Average Periodic Refresh Interval
- 2.5 V (SSTL\_2 compatible) I/O
- $V_{\text{DD}} = 2.5 \text{ V} \pm 0.2 \text{ V}$
- $V_{\text{DDQ}} = 2.5 \text{ V} \pm 0.2 \text{ V}$
- Packages: PG-TSOP166, PG-TFBGA-60, P-TSOP166, P-TFBGA-60
- RoHS Compliant Products

512-Mbit Double-Data-Rate SDRAM

## 1.2 Description

The 512-Mbit is a high-speed CMOS, dynamic random-access memory containing 536, 870, 912 bits. It is internally configured as a quad-bank DRAM.

The 512-Mbit Double-Data-Rate SDRAM uses a double-data-rate architecture to achieve high-speed operation. The double data rate architecture is essentially a 2n prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the 512-Mbit Double-Data-Rate SDRAM effectively consists of a single 2n-bit wide, one clock cycle data transfer at the internal DRAM core and two corresponding n-bit wide, one-half-clock-cycle data transfers at the I/O pins.

A bidirectional data strobe (DQS) is transmitted externally, along with data, for use in data capture at the receiver. DQS is a strobe transmitted by the DDR SDRAM during Reads and by the memory controller during Writes. DQS is edge-aligned with data for Reads and center-aligned with data for Writes.

The 512-Mbit Double-Data-Rate SDRAM operates from a differential clock (CK and  $\overline{\text{CK}}$ ; the crossing of CK going HIGH and  $\overline{\text{CK}}$  going LOW is referred to as the positive edge of CK). Commands (address and control signals) are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

Read and write accesses to the DDR SDRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an Active command, which is then followed by a Read or Write command. The address bits registered coincident with the Active command are used to select the bank and row to be accessed. The address bits registered coincident with the Read or Write command are used to select the bank and the starting column location for the burst access.

The DDR SDRAM provides for programmable Read or Write burst lengths of 2, 4 or 8 locations. An Auto Precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst access. As with standard SDRAMs, the pipelined, multibank architecture of DDR SDRAMs allows for concurrent operation, thereby providing high effective bandwidth by hiding row precharge and activation time.

An auto refresh mode is provided along with a power-saving power-down mode. All inputs are compatible with the Industry Standard for SSTL\_2. All outputs are SSTL\_2, Class II compatible.

*Note: The functionality described and the timing specifications included in this data sheet are for the DLL Enabled mode of operation.*

# 3 Functional Description

The 512-Mbit Double-Data-Rate SDRAM uses a double-data-rate architecture to achieve high-speed operation.

## 3.1 Mode Register Definition

The Mode Register is used to define the specific mode of operation of the DDR SDRAM.

**TABLE 10**  
Mode Register Definition

### 3.1.1 Burst Type

Accesses within a given burst may be programmed to be either sequential or interleaved; this is referred to as the burst type and is selected via bit A3. The ordering of accesses within a burst is determined by the burst length, the burst type and the starting column address, as shown in **Table 11**.

**TABLE 11**  
Burst Definition

Burst Length	Starting Column Address			Order of Accesses Within a Burst	
	A2	A1	A0	Type = Sequential	Type = Interleaved
2			0	0-1	0-1
			1	1-0	1-0
4		0	0	0-1-2-3	0-1-2-3
		0	1	1-2-3-0	1-0-3-2
		1	0	2-3-0-1	2-3-0-1
		1	1	3-0-1-2	3-2-1-0
8	0	0	0	0-1-2-3-4-5-6-7	0-1-2-3-4-5-6-7
	0	0	1	1-2-3-4-5-6-7-0	1-0-3-2-5-4-7-6
	0	1	0	2-3-4-5-6-7-0-1	2-3-0-1-6-7-4-5
	0	1	1	3-4-5-6-7-0-1-2	3-2-1-0-7-6-5-4
	1	0	0	4-5-6-7-0-1-2-3	4-5-6-7-0-1-2-3
	1	0	1	5-6-7-0-1-2-3-4	5-4-7-6-1-0-3-2
	1	1	0	6-7-0-1-2-3-4-5	6-7-4-5-2-3-0-1
	1	1	1	7-0-1-2-3-4-5-6	7-6-5-4-3-2-1-0

**Notes**

1. For a burst length of two, A1-Ai selects the two-data-element block; A0 selects the first access within the block.
2. For a burst length of four, A2-Ai selects the four-data-element block; A0-A1 selects the first access within the block.
3. For a burst length of eight, A3-Ai selects the eight-data-element block; A0-A2 selects the first access within the block.
4. Whenever a boundary of the block is reached within a given sequence above, the following access wraps within the block.

### 3.2 Extended Mode Register

The Extended Mode Register controls functions beyond those controlled by the Mode Register.

**TABLE 12**

- 1) CKE is HIGH for all commands shown exceptSelf Refresh.  $V_{REF}$  must be maintained during Self Refresh operation.
- 2) Deselect and NOP are functionally interchangeable.
- 3) BA0, BA1 provide bank address and A0 - Ai provide row address.
- 4) BA0, BA1 provide bank address; A0 - Ai provide column address ; A10 HIGH enables the Auto Precharge feature (nonpersistent), A10 LOW disables the Auto Precharge feature.
- 5) Applies only to read bursts with Auto Precharge disabled; this command is undefined (and should not be used) for read bursts with Auto Precharge enabled or for write bursts.
- 6) A10 LOW: BA0, BA1 determine which bank is precharged. A10 HIGH: all banks are precharged and BA0, BA1 are "Don't Care".
- 7) This command is AUTO REFRESH if CKE is HIGH; Self Refresh if CKE is LOW
- 8) Internal refresh counter controls row and bank addressing; all inputs and I/Os are "Don't Care" except for CKE.
- 9) BA0, BA1 select either the Base or the Extended Mode Register (BA0 = 0, BA1 = 0 selects Mode Register; BA0 = 1, BA1 = 0 selects Extended Mode Register; other combinations of BA0-BA1 are reserved; A0 - Ai provide the op-code to be written to the selected Mode Register.

	H	H	See <b>Table 16</b>	–	–

1)  $V_{REF}$  must be maintained during Self Refresh operation

2) Deselect or NOP commands should be issued on any clock edges occurring during the Self Refresh Exit ( $t_{XSNR}$ ) period. A minimum of 200 clock cycles are needed before applying a read command to allow the DLL to lock to the input clock.

1. CKEn is the logic state of CKE at clock edge n: CKE n-1 was the state of CKE at the previous clock edge.
2. Current state is the state of the DDR SDRAM immediately prior to clock edge n.
3. COMMAND n is the command registered at clock edge n, and ACTION n is a result of COMMAND n.
4. All states and sequences not shown are illegal or reserved.

- 1) This table applies when CKE n-1 was HIGH and CKE n is HIGH (see **Table 15** and after  $t_{XSNR}/t_{XS RD}$  has been met (if the previous state was self refresh).
- 2) This table is bank-specific, except where noted, i.e., the current state is for a specific bank and the commands shown are those allowed to be issued to that bank when in that state. Exceptions are covered in the notes below.
- 3) Current state definitions: Idle: The bank has been precharged, and  $t_{RP}$  has been met. Row Active: A row in the bank has been activated, and  $t_{RCD}$  has been met. No data bursts/accesses and no register accesses are in progress. Read: A Read burst has been initiated, with Auto Precharge disabled, and has not yet terminated or been terminated. Write: A Write burst has been initiated, with Auto Precharge disabled, and has not yet terminated or been terminated.
- 4) The following states must not be interrupted by a command issued to the same bank. Precharging: Starts with registration of a Precharge command and ends when  $t_{RP}$  is met. Once  $t_{RP}$  is met, the bank is in the idle state. Row Activating: Starts with registration of an Active command and ends when  $t_{RCD}$  is met. Once  $t_{RCD}$  is met, the bank is in the “row active” state. Read w/Auto Precharge Enabled: Starts with registration of a Read command with Auto Precharge enabled and ends when  $t_{RP}$  has been met. Once  $t_{RP}$  is met, the bank is in the idle state. Write w/Auto Precharge Enabled: Starts with registration of a Write command with Auto Precharge enabled and ends when  $t_{RP}$  has been met. Once  $t_{RP}$  is met, the bank is in the idle state. Deselect or NOP commands, or allowable commands to the other bank should be issued on any clock edge occurring during these states. Allowable commands to the other bank are determined by its current state and according to **Table 17**.
- 5) The following states must not be interrupted by any executable command; Deselect or NOP commands must be applied on each positive clock edge during these states. Refreshing: Starts with registration of an Auto Refresh command and ends when  $t_{RFC}$  is met. Once  $t_{RFC}$  is met, the DDR SDRAM is in the “all banks idle” state. Accessing Mode Register: Starts with registration of a Mode Register Set command and ends when  $t_{MRD}$  has been met. Once  $t_{MRD}$  is met, the DDR SDRAM is in the “all banks idle” state. Precharging All: Starts with registration of a Precharge All command and ends when  $t_{RP}$  is met. Once  $t_{RP}$  is met, all banks is in the idle state.
- 6) All states and sequences not shown are illegal or reserved.
- 7) Not bank-specific; requires that all banks are idle.
- 8) Reads or Writes listed in the Command/Action column include Reads or Writes with Auto Precharge enabled and Reads or Writes with Auto Precharge disabled.
- 9) May or may not be bank-specific; if all/any banks are to be precharged, all/any must be in a valid state for precharging.
- 10) Not bank-specific; BURST TERMINATE affects the most recent Read burst, regardless of bank.
- 11) Requires appropriate DM masking.

- 1) This table applies when CKE n-1 was HIGH and CKE n is HIGH (see **Table 15**: Clock Enable (CKE) and after  $t_{XSNR}/t_{XSRD}$  has been met, if the previous state was self refresh)
- 2) This table describes alternate bank operation, except where noted, i.e., the current state is for bank n and the commands shown are those allowed to be issued to bank m (assuming that bank m is in such a state that the given command is allowable). Exceptions are covered in the notes below.
- 3) Current state definitions: Idle: The bank has been precharged, and  $t_{RP}$  has been met. Row Active: A row in the bank has been activated, and  $t_{RCD}$  has been met. No data bursts/accesses and no register accesses are in progress. Read: A Read burst has been initiated, with Auto Precharge disabled, and has not yet terminated or been terminated. Write: A Write burst has been initiated, with Auto Precharge disabled, and has not yet terminated or been terminated.
- 4) AUTO REFRESH and Mode Register Set commands may only be issued when all banks are idle.
- 5) A BURST TERMINATE command cannot be issued to another bank; it applies to the bank represented by the current state only.
- 6) All states and sequences not shown are illegal or reserved.
- 7) Reads or Writes listed in the Command/Action column include Reads or Writes with Auto Precharge enabled and Reads or Writes with Auto Precharge disabled.
- 8) Requires appropriate DM masking.
- 9) **Concurrent Auto Precharge:** This device supports “Concurrent Auto Precharge”. When a read with auto precharge or a write with auto precharge is enabled any command may follow to the other banks as long as that command does not interrupt the read or write data

## 5 Electrical Characteristics

This chapter describes the electrical characteristics.

### 5.1 Operating Conditions

This chapter contains the operating conditions tables.

**TABLE 19**  
Absolute Maximum Ratings

Parameter	Symbol	Values			Unit	Note
		Min.	Typ.	Max.

Voltage on inputs relative to $V_{SS}$	$V_{IN}$	-1	—	+3.6	V	—
Voltage on $V_{DD}$ supply relative to $V_{SS}$	$V_{DD}$	-1	—	+3.6	V	—
Voltage on $V_{DDQ}$ supply relative to $V_{SS}$	$V_{DDQ}$	-1	—	+3.6	V	—
Operating temperature (ambient)	$T_A$	0	—	+70	°C	for HYB...
		-40	—	+85	°C	for HYI...
Storage temperature (plastic)	$T_{STG}$	-55	—	+150	°C	—
Power dissipation (per SDRAM component)	$P_D$	—	1	—	W	—
Short circuit output current	$I_{OUT}$	—	50	—	mA	—

**Attention:** Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

Delta Input/Output Capacitance: DQ, DQS, DM	C <sub>dIO</sub>	—	—	0.5	pF	<sup>1)</sup>

1) These values are guaranteed by design and are tested on a sample base only.  $V_{DDQ} = V_{DD} = 2.5 \text{ V} \pm 0.2 \text{ V}$ ,  $f = 100 \text{ MHz}$ ,  $T_A = 25 \text{ }^\circ\text{C}$ ,  $V_{OUT(DC)} = V_{DDQ}/2$ ,  $V_{OUT}$  (Peak to Peak) 0.2 V. Unused pins are tied to ground.

2) DM inputs are grouped with I/O pins reflecting the fact that they are matched in loading to DQ and DQS to facilitate trace matching at the board level.

- 1)  $0^\circ C \leq T_A \leq 70^\circ C$ ;  $V_{DD} = V_{DDQ} = 2.5 V \pm 0.2 V$
- 2) Under all conditions,  $V_{DDQ}$  must be less than or equal to  $V_{DD}$ .
- 3) Peak to peak AC noise on  $V_{REF}$  may not exceed  $\pm 2\% V_{REF,DC}$ .  $V_{REF}$  is also expected to track noise variations in  $V_{DDQ}$ .
- 4)  $V_{TT}$  is not applied directly to the device.  $V_{TT}$  is a system supply for signal termination resistors, is expected to be set equal to  $V_{REF}$ , and must track variations in the DC level of  $V_{REF}$ .
- 5) Inputs are not recognized as valid until  $V_{REF}$  stabilizes.
- 6)  $V_{ID}$  is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .
- 7) The ratio of the pull-up current to the pull-down current is specified for the same temperature and voltage, over the entire temperature and voltage range, for device drain to source voltage from 0.25 to 1.0 V. For a given output, it represents the maximum difference between pull-up and pull-down drivers due to process variation.
- 8) Values are shown per pin.

## 5.2 AC Characteristics

Notes 1-5 apply to the following Tables; Electrical Characteristics and DC Operating Conditions, AC Operating Conditions,  $I_{DD}$  Specifications and Conditions, and Electrical Characteristics and AC Timing.

### Notes

1. All voltages referenced to  $V_{SS}$ .
2. Tests for AC timing,  $I_{DD}$ , and electrical, AC and DC characteristics, may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.
3. **Figure 5** represents the timing reference load used in defining the relevant timing parameters of the part. It is not intended to be either a precise representation of the typical system environment nor a depiction of the actual load presented by a production tester. System designers will use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers will correlate to their production test conditions (generally a coaxial transmission line terminated at the tester electronics).
4. AC timing and  $I_{DD}$  tests may use a  $V_{IL}$  to  $V_{IH}$  swing of up to 1.5 V in the test environment, but input timing is still referenced to  $V_{REF}$  (or to the crossing point for CK,  $\overline{CK}$ ), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals is 1 V/ns in the range between  $V_{IL(AC)}$  and  $V_{IH(AC)}$ .
5. The AC and DC input level specifications are as defined in the SSTL\_2 Standard (i.e. the receiver effectively switches as a result of the signal crossing the AC input level, and remains in that state as long as the signal does not ring back above (below) the DC input LOW (HIGH) level).
6. For System Characteristics like Setup & Holdtime Derating for Slew Rate, I/O Delta Rise/Fall Derating, DDR SDRAM Slew Rate Standards, Overshoot & Undershoot specification and Clamp  $V$ - $I$  characteristics see the latest Industry specification for DDR components.

- 2) Input slew rate = 1 V/ns.
- 3) Inputs are not recognized as valid until  $V_{REF}$  stabilizes.
- 4)  $V_{ID}$  is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .
- 5) The value of  $V_{IX}$  is expected to equal  $0.5 \times V_{DDQ}$  of the transmitting device and must track variations in the DC level of the same.

- 1)  $0\text{ }^{\circ}\text{C} \leq T_A \leq 70\text{ }^{\circ}\text{C}$ ;  $V_{DD} = V_{DDQ} = 2.5\text{ V} \pm 0.2\text{ V}$
- 2) Input slew rate  $\geq 1\text{ V/ns}$ .
- 3) The CK/ $\overline{\text{CK}}$  input reference level (for timing reference to CK/ $\overline{\text{CK}}$ ) is the point at which CK and  $\overline{\text{CK}}$  cross: the input reference level for signals other than CK/ $\overline{\text{CK}}$ , is  $V_{REF}$ . CK/ $\overline{\text{CK}}$  slew rate are  $\geq 1.0\text{ V/ns}$ .
- 4) Inputs are not recognized as valid until  $V_{REF}$  stabilizes.
- 5) The Output timing reference level, as measured at the timing reference point indicated in AC Characteristics (note 3) is  $V_{TT}$ .
- 6) For each of the terms, if not already an integer, round to the next highest integer.  $t_{CK}$  is equal to the actual system clock cycle time.
- 7)  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referred to a specific voltage level, but specify when the device is no longer driving (HZ), or begins driving (LZ).
- 8) Fast slew rate  $\geq 1.0\text{ V/ns}$ , slow slew rate  $\geq 0.5\text{ V/ns}$  and  $< 1\text{ V/ns}$  for command/address and CK &  $\overline{\text{CK}}$  slew rate  $> 1.0\text{ V/ns}$ , measured between  $V_{IH,AC}$  and  $V_{IL,AC}$ .
- 9) These parameters guarantee device timing, but they are not necessarily tested on each device.
- 10) The specific requirement is that DQS be valid (HIGH,LOW, or some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from Hi-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW at this time, depending on  $t_{DQSS}$ .
- 11) The maximum limit for this parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.

- 1) Input slew rate = 1 V/ns.
- 2) Enables on-chip refresh and address counters.
- 3) Test conditions for typical values:  $V_{DD} = 2.5$  V (DDR333),  $V_{DD} = 2.6$  V (DDR400),  $T_A = 25$  °C, test conditions for maximum values:  $V_{DD} = 2.7$  V,  $T_A = 10$  °C.
- 4)  $I_{DD}$  specifications are tested after the device is properly initialized and measured at 166 MHz for DDR333, and 200 MHz for DDR400.
